

Drama Princess

Original title: Drama Princess

Drama Princess is an attempt to create a reusable virtual actor. The personality of each instance of the module can be defined by a few parameters. With those parameters, the virtual actors can respond to each other and their environment in individual ways. The focus is on expressiveness and dramatic effect rather than simulation and artificial intelligence. The desire is to build a Dramatic Agent or a Virtual Actor. An Artificial Life focussed on emotional expression. Not a single Drama Princess but a Universal Virtual Robot, a class or system capable of playing many parts, autonomously, with minimal configuration which can be used and re-used in our real-time 3d entertainment projects.

CREDITS
